### Indian Ocean Commission

Islands Project on the implementation of the 2005 Mauritius Strategy (MS) for the Sustainable Development of Small Island Developing States (SIDS).  
Funded by EU/ EuropAid

**MID** COMMISSION  
**Maurice Ile Durable**  
Mauritius Sustainable Island  
Commission  
(Prime Minister Office)

Supervision of tests + data supply + future implementation

## The project background

- **Clear policy demand:**
  - **International:** The Programme of Action for the Sustainable Development of Small Island Developing States adopted in Mauritius, 2005 (the Mauritius SD Strategy) and its implementation by the Indian Ocean Commission
  - **National:** well identified SD issues, “green growth”, “blue growth”, “green economy”, fast change in sugar cane agriculture, tourism, urban sprawl, degradation of lagoon fisheries and coral reefs...
  - **Natural Capital/Ecosystem Accounting:** a demand by the Ministry of Finance and Economic Development and MID, the “Maurice Ile Durable” Commission, to the Indian Ocean Commission (Islands Project, EU/EuropAid funding).
- **UNFCCC/IPCC reporting** (Meteo Services, with SM), National GHG inventory report of the Republic of Mauritius 2000-2006 (2010).
- **Tradition in environmental statistics** (a statistician based in the Ministry of Environment, a statistician member of the FDES revision group...)
- **Environment-Economic Accounts, 2002 – 2009, Statistics Mauritius (SM)**, covering ‘Energy Use and Atmospheric Emissions’ for the period 2002 to 2009, ‘Water Use’ for years 2002 and 2007 and ‘Economy-wide Material Flow Accounts (MFA)’ covering period 2005 to 2009 (UNDP + support). Update of SEEA-water accounts in 2013 (UNSD mission).

## The project implementation

- **First phase (2013):** Inception (with MID, IOC and SM), visit to 12 organisations, collection of data and statistics (with strong support from SM), two “training” sessions (presentation of the methodology), two stakeholders meetings (data requirements, the way forward...), creation of the database for accounting, production of preliminary accounts, production of a first detailed action plan.
- **Intermediate period:** presentation of results at the UNEP VANTAGE Conference in Nairobi Dec. 2013, at UNEP Workshop on the draft guidelines for ecosystem services valuation and accounting in SIDS (New York, Feb. 2014); policy meetings in Mauritius and decision to create a special unit for environment accounting within SM.
- **Second phase (May-June 2014):** Installation of the Steering Committee (Chaired by MID), preparation of a specific action on land cover mapping (MID, Ministry of Finance, Ministry of Environment and Agence Française de Développement), data transfer and (first) technical training of staff in the SM new unit, revision of the 2013 draft report in view of publication by IOC of a report on preliminary ecosystem natural capital accounts for Mauritius; drafting of ToR for land cover mapping and accounts; and...
- **revision of the 2013 action plan** for Mauritius 3<sup>rd</sup> phase: consolidation and completion of first core accounts, development of cases studies for coastal zones/ tourism/ recreation/ fisheries; medium term capacity development, technical training of staff (ecosystem accounting, GIS, database management etc...); preparation of the extension to other IOC countries.

## Conclusions

- **Integrated ecosystem natural capital accounts are feasible** in Mauritius with existing data which are available in the country or/and from international programmes. NB Land cover change requires specific investment at early stage. Simplified accounts can be produced (rather) quickly and deliver relevant results; their accuracy can be improved in subsequent steps on the basis of the data gaps identified in the first test – and additional data collection.
- **The cost of IT investments is no more an issue**; performing freeware can be used as well as commercial software packages – and cloud computing has started to propose solutions and deliver products from the web.
- **Staffing & training (in statistics and accounting, data management, GIS applications) are the main capacity building issues (need 2 to 3 staff in the central unit + correspondents in partner organisations). External technical support to implementing agencies is needed for the creation of the first database (typically annual accounts 2000-2012)**
- Institutional cooperation between the various agencies holding data and knowledge is essential. Creation of a **shared environmental information system** is recommended.
- **The implementation of integrated physical accounts should facilitate further work on assessment, modelling and valuation of ecosystem services** (*today, data collection alone represents up to 80% of the cost of most environmental studies*)

## Ecosystems/Natural Capital Accounts of Mauritius: Results of the Pilot Study 2013

- Context: Mauritius Sustainable Development Strategy, “Maurice Ile Durable”
- Support: Indian Ocean Commission, European Union
- An experimentation of SEEA-Experimental Ecosystem Accounting
- Operator: Statistics Mauritius
- Contributors: more than 10 public organisations
- Duration: over a 7 months period, the equivalent of 5 man-months all in all (consultant + national statistician)
- Preliminary results...

- M05 Tea
- M02 Transport
- M01 Urban

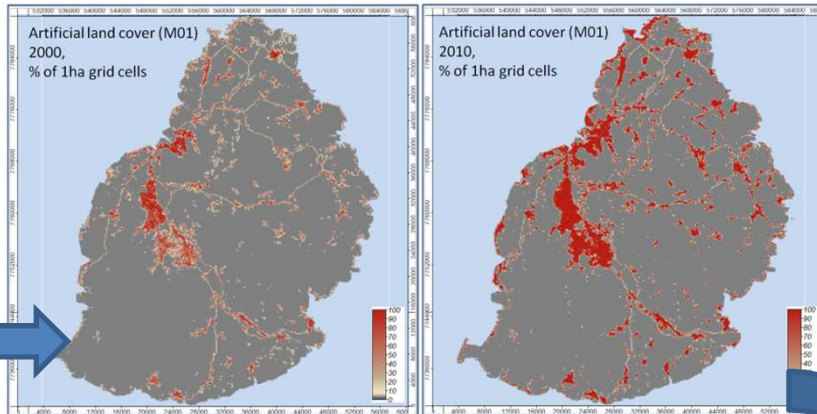

# SEEA-ENCA Mauritius preliminary results : Land cover and change from 2000 to 2010

The land cover data are stored using geographical datasets which use grids (10m x 10m and 100m x 100m) at the most detailed level.

These grids allow computing statistics and producing ecosystems/natural capital accounts for various statistical units such as municipal and village council areas, districts, coastal zones, river basins, socio-ecological landscape units and any relevant zoning.

## The biomass-carbon account

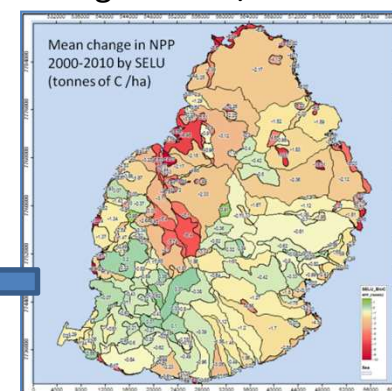

Carbon Accounts show the capacity of the ecosystems to produce biomass and the way it is used by crops harvests and trees removal or sometimes sterilised by artificial developments or destroyed by soil erosion or forest fires (in line with IPCC guidelines).

Accounts are compiled using various sources such as products based on earth observation by satellite (e.g. MODIS NPP), on in situ monitoring (for IPCC-LULUCF, FAO/soil, FRA2010) and official statistics .

# SEEA-ENCA Mauritius preliminary results : The ecosystem water account

The ecosystem water accounts follows the SEEA Water methodology and use preliminary results of the national water accounts. They are detailed by river basins and sub-basins where the hydrological system can be described consistently. Stocks of water are mainly aquifers and lakes/reservoirs, which play important role in Mauritius. Data have provided by the meteorological and water agencies. Water use by sub-basins is estimated from population census data and irrigation map. Satellite products have been used for evapotranspiration. The outcome is the calculation of the water really accessible for use and of an index of stress from water use intensity.

Accessible water, mean amount by ha,  $10^3 \text{ m}^3$

Water use intensity stress index (stress when <100)

## The functional services account (depending from integrity and biodiversity)

The biodiversity of systems and species account is made of two accounts which describe the state of ecosystems green infrastructure (landscapes, rivers and sea coastal zones) on the one hand and changes in species biodiversity on the other hand.

The NLEP index combines the green character of ecosystems and their fragmentation by roads which may alter their good functioning. Land cover is then weighted with NLEP.

Highest NLEP values can be found where forests, shrubs, grass and natural habitats are predominant, in particular in mountainous and land coastal areas. Low NLEP values correspond to urbanised areas and intermediate score reflect agriculture dominated catchments.

# SEEA-ENCA Mauritius preliminary results : the Sea Coastal Ecosystems test account

Coastal ecosystems play important role in Mauritius and a test has been done in a domain where little practical accounting experience exists. The methodology for land ecosystems has been extended to the lagoons for which ecosystem accounting units (EAU) have been defined and mapped . A test account of been produced using the inventory of “Environmentally Sensitive Areas”, using the indicator of coral reefs vulnerability, on the one hand and urban pressure on coastal ecosystems on the other hand .The conclusion is that the SEEA-ENCA methodology can be implemented in full.

## Summary: 5 steps for implementing ecosystem natural capital accounts

<i>Objective</i>	<i>Datasets/ Accounts</i>	<i>Tasks to the accountant</i>
<b>Step 1: Create the data infrastructure needed for accounting</b>		
<b>Collect reference geographical datasets and create the database of Ecosystem Accounting Units</b>	<p>Geographical features/zonings</p> <ul style="list-style-type: none"> <li>Physical boundaries (coastline, river basins &amp; sub-basins limits, climate zoning, elevation classes)</li> <li>Administrative boundaries (municipalities, districts, regions)</li> <li>Transport network</li> <li>Hydrological network, rivers, aquifers</li> <li>Sea/fisheries zoning(s)</li> </ul> <p>Regular grid(s) for accounting (1 ha and 1 km<sup>2</sup>)</p>	<p>Collect from relevant organisations the basic geographical layers which will structure the physical accounts. Check their consistency (geometry, projection). Produce a set of regular grids (based on official geographical standards).</p> <p>Create the database of <b>Ecosystem Accounting Units</b> for terrestrial ecosystems, rivers, marine coastal units and other sea accounting units</p> <p>(NB: requires land cover map for the baseline year)</p>
<b>Step 2: Collect the basic datasets</b>		
<b>Collect the basic datasets for ecosystem natural capital accounting: monitoring data and statistics</b>	<ul style="list-style-type: none"> <li>Land cover change (including marine coastal areas)</li> <li>Meteorological data</li> <li>Hydrological data</li> <li>Soil data</li> <li>Data on forest stocks and growth</li> <li>Population data</li> <li>Regular agriculture, forestry and fishery statistics</li> <li>Data/statistics on water use</li> <li>Indicators on species and systems biodiversity</li> </ul>	<p>Produce a consistent multi-annual (10 to 20 years period) land cover map/database using satellite images and other sources available (forest maps, cadastre, buildings and roads...).</p> <p>Collect and <u>organise</u> the various sets of data needed for accounting. Official data sources are given priority: official statistics, meteorological data, hydrological data... where available, accounts produced for IPCC reporting, REDD+, SEEA Water... are important inputs. Satellite data sometimes as second best.</p>

## Summary: 5 steps for implementing ecosystem natural capital accounts

<i>Objective</i>	<i>Datasets/ Accounts</i>	<i>Tasks to the accountant</i>
<b>Step 3: Produce the core accounts</b>		
<b>Produce the core ecosystem natural capital accounts, measure total ecosystem capability, assess degradation or enhancement</b>	<ul style="list-style-type: none"> <li>• Land cover change account</li> <li>• Ecosystem carbon account</li> <li>• Ecosystem water account</li> <li>• Ecosystem integrity and functional services accounts</li> <li>• Ecosystem overall capability account (including exchanges between ecosystems)</li> </ul>	<i>Compile the accounts with basic data collected at step 2, additional data for specific items and physical data <u>modelling</u>. Geo-process datasets. Estimate of missing data. Integrate of the accounts.</i>
<b>Step 4: Functional accounts in physical units</b>		
<b>Functional analysis of ecosystem capital and services in physical units</b>	<ul style="list-style-type: none"> <li>• Accountability of economic sectors to ecosystem capital degradation /enhancement</li> <li>• Ecosystem degradation embedded into trade</li> <li>• Ecological Balance Sheet (in ECU)</li> <li>• Social demand for ecosystem services (by ecosystem units, municipalities, regions...)</li> </ul>	<i>Targeted, detailed analysis to be carried out with statistical offices, planning agencies, environment agencies, research sector...</i> <i>Compilation of the ecological balance-sheet</i>  <i>Mapping and assessing ecosystem services</i>
<b>Step 5: Functional accounts in monetary units</b>		
<b>Functional analysis of ecosystem capital and services in monetary units: measurement of unpaid degradation costs; valuation of ecosystem services</b>	<ul style="list-style-type: none"> <li>• <u>Unpaid remediation costs</u>: Accountability of economic sectors to ecosystem capital degradation /enhancement</li> <li>• Ecosystem degradation embedded in trade</li> <li>• Ecological Balance Sheet in money</li> <li>• Adjustment of the Final Demand from unpaid costs</li> <li>• <u>Monetary value of key ecosystem services</u></li> <li>• Total (direct and indirect) value added induced by ecosystem services (agriculture, forestry, fishery, water, tourism...)</li> </ul>	<i>Economic analysis of remediation costs (restoration works, alleviation, opportunity costs of reducing pressure on ecosystems...).</i> <i>Economic analysis of ecosystem services monetary value.</i> <u>Input/Output analysis of Value Added induced by ecosystem services; sustainability assessment</u>
<b>Steps 1 to 3 have to be done for all ecosystems and sectors. Steps 4 and 5 can focus on one particular ecosystem, service or economic sector.</b>		

**Thank you!**
