> Physical metrics for recreation related ecosystem services and the use of mobile big data for valuation of the services from free-access open spaces

> > Takashi Hayashi (Policy Research Institute, MAFF, JPN) Daisuke Kunii (Policy Research Institute, MAFF, JPN) Masayuki Sato (Kobe University, JPN)

## Today's topic

- 1. Backgrounds
- 2. Data sources of mobile location big data (MLBD)
- 3. An application of MLBD for the valuation
- 4. SEEA-EA for RES in Kyushu
- 5. Considerations
- 6. Conclusions

#### 1. Backgrounds

- Recreational related ecosystem services (RES) are unique in terms of the valuation
  - It is defined only from a user perspective (SEEA-EA, para 6.117)
  - It encompasses experimental and non-material connection between people and ecosystems (SEEA-EA, para 6.116)
  - Their value is recognized only when they are directly used or consumed by people
- Physical metrics of RES
  - The number of visits to a specific natural location is regarded as a suitable proxy (SEEA-EA, para7.49)
- Monetary valuation of RES
  - Travel cost method (TCM) is often used
  - In the method, the number of visits is also crucial

The number of visits is crucial data for RES

### 1. Backgrounds

- How to obtain the data on N. of visits
  - Onsite social surveys in most cases
  - However, for free access open spaces which have no identified entrances and exits, such kind of survey is not applicable

#### • One of the solutions

- To utilize big data, specifically mobile location big data (MLBD)
- MLBD have already utilized in various research fields

#### • Purposes of this study

- To introduce how to utilize big data for the valuation of ecosystem services focusing on MLBD and to examine pros and cons of the data
- To apply MLBD to the valuation of RES using cases in Japan

### 2. Data sources of MLBD

#### Three different types of MLBD

- Mesh
  - Appropriate for relatively large areas
  - Easy to connect with other mesh-formed statistical data
  - May include not only target area but also other non-target areas
- Polygon
  - Possible to identify a small target area: urban green space, one plot of land etc.
  - A polygon can be defined freely by users and easy to analyze the data
  - Users have to define a polygon by oneself, and it may in turn be a timeconsuming and requires much works especially when target areas are large
- Point
  - Easy to understand the movement of a person at a street level
  - Not also suitable for a larger area
- Data selection
  - Depends on in which area one should value ecosystem services

#### 2. Data sources of MLBD

	21	Ũ	
	NTT docomo Softbank	KDDI	Softbank
Data type	• Meshes	Self-defined polygons	Self-defined points
Acquisition of	• By GPS via communication	• By GPS function in a gadget	• By a specific application
data	base station		
Attribution of	· Connected with officially	· Connected with officially	• Data voluntarily registered by
visitors	certificated data used for	certificated data used for	users
VISICOIS	mobile phone contracts	mobile phone contracts	
	Age, gender, etc.	Age, gender, etc.	Presumption from registered data
Advantages	• Large number of samples	• Able to define any areas and	• Able to analyze at street level
Auvantages		to obtain data in the areas	
	• Able to combine with other	• Able to analyze a specific	• Able to analyze with detailed
	mesh-formed statistical data	facility or area	location data
			• Able to analyze on the movement
			within a small area
	• Data availability depends on	• Data available only for those	• Data available only for those who
Disadvantages	the location of communication	who accept to the data	use the application AND accept to
-	dase stations, causing low data	provision	the data provision
	availability for small population	• Not suitable for analysis of	Possibility for biased data
	areas	larga area	1 ossionity for oused data
		large area	• Low data availability for small
~			population areas
Sample size	•Huge (Tens of millions)	•Big (Millions)	•Small (Hundreds of thousands)
Suitable to	Larger area 🗲		Smaller area

### 3. An Application of MLBD for the valuation

• Study site

8

# 3. An Application of MLBD for the valuation

- Valuation target: terraced rice paddies (TRPs)
  - There are 48 TRPs in Kyushu which are registered to "The Best 100 TRPs in Japan"
  - Among which 16 have visitor accommodation facilities (observation points, parking spaces, rest spaces, etc.)
  - We chose these 16 TRPs for valuation target
- Data collection
  - Apply polygon type MLBD provided by KDDI
  - Data is collected for all 16 TRPs in each month from 2018 to 2022
  - But at moment, we conducted trial data collection and only data in May and in September. from 2018 to 2021 is collected

# 3. An Application of MLBD for the valuation

- Valuation with travel cost method (TCM)
  - $-TC_{ij} = C_{Tij} * 2 + C_{Oij}$
  - $TC = \sum_{j} (\sum_{i} (TC_{ij}) * V_j)$ 
    - $C_{Tij}$ : one-way transportation cost for visitor *i* from city *j*
    - $C_{Oij}$ : opportunity cost
    - $-V_j$ : N. of visits from city j
- Data collection
  - Apply polygon type MLBD provided by KDDI
  - Data is collected for all 16 TRPs in each month from 2018 to 2022
  - But at moment, only data in May and in September from 2018 to 2021 is collected

Supply and use tables (monetary and physical) 11

#### 5. Considerations

- Advantages of MLBD utilization
  - Visitation data can be obtained from free-access open spaces
  - A couple of data sources are available depending on valuation targets from local to national scales
  - Past data is available

### 5. Considerations

- Limitations
  - In all types of MLBD, the data provided to public is anonymized, and are not actual visitation figures and manipulated by data supplier due to constraint on the provision of private information
  - The data is updated at any time
    - Results vary depending on the date we conduct the valuation
  - Missing link with visitors' information

These challenges may lead to inaccurate valuation and upgrade of the databases are strongly required

#### Difference in figures between data obtained January 2023 (1<sup>st</sup>) and that obtained in June 2023 (2<sup>nd</sup>)

	Visita	tion in May	/ 2018	Visitation in Sept. 2018				
	1st	2nd	Ratio	1st	2nd	Ratio		
Origin	analysis	analysis	Natio	analysis	analysis	Natio		
Chiba	46	62	1.35	NA	NA			
Tokyo	NA	NA		NA	NA

Oita	NA	NA		NA	NA			
Total	592	679	1.15	237	274	1.16		

### 6. Conclusions

- Recently, the development of big data is accelerating worldwide
- We investigated the possibility to utilize the data for valuations of ecosystems and their service particularly for RES
- Although MLBD hold a possibility to improve the valuation of ecosystems and their services, there also are some (big) challenges which have to be tackled
- So at moment, the contribution of MLBD to precise estimation of visitors is limited in the case of this study, which is very small area like TRPs
- We hope that the databases will be upgraded so that it can be utilized for SEEA accounts

### 6. Conclusions

- Big data including MLBD is still in the stage of development and will be improved and updated in the near future
- We, authors will continue to keep eye on the development and improvement of big data.
- We believe that it is important to utilize these new data sources in the context of SEEA framework and concepts and to discuss how we, can utilize it for SEEA completion

# Thank you very much!
