Session 12: Communication Tools: Presenting the Accounts to Policymakers

28-31 October 2019, Pretoria, South Africa

#SEEAfricaTraining

@UNStats @GDSAofficial1 @ECA_OFFICIAL
@UNEnvironment @StatsSA @EU_ENV

Outline

- Video
- General points on communications
- Use of data visualization
- Examples and tools

African countries lead on natural capital accounting

<http://www.gaboronedeclaration.com/nca>

[video](#)

How do we ensure that statisticians and the policymakers are looking the same way?

Competing demands for information: zooming in or zooming out?

Competing demands for information: complexity or nuance?

or cost.

The dynamics of the shadow value of the wildlife stock to the community are de

$$\dot{\gamma} = -R_w - \alpha p H_w - \beta T_w + \gamma (\delta - F_w + H_w + Q_w) \quad (6)$$

Community Requirements for a Steady State

In a steady state, $\dot{W} = 0$, and off-take from hunting and poaching must equal gro

$$H(W, A) + Q(W, A) = F(W) \quad (7)$$

onally, $\dot{\gamma} = 0$ and the shadow value of wildlife equals

$$\gamma^* = \frac{R'(W) + \beta T'(W) + \alpha p H_w(W, A)}{\delta - F'(W) + H_w(W, A) + Q_w(W, A)} \quad (8)$$

Note that this shadow value can be positive or negative, depending on the sign of the marginal net benefits to the community (let $MNB = R_w + \alpha p H_w + \beta T_w$) and on the discount rate over the marginal net growth (natural replenishment rate net of hunting and poaching, or $MNG = F_w - H_w - Q_w$). As Horan and Bulte (2004) discuss, the ambiguity in the sign of the shadow value leads to the possibility of multiple equilibria.

Competing demands for information: complexity or nuance?

Thoughts on Messaging

“If you can’t explain it simply,
you don’t understand it well
enough.” – Albert Einstein

- Too many messages translate into no message. Try to boil down to one or two.
- Get to the point as quickly as possible. (The opposite of the academic template - put conclusions up front).
- Rule of thumb: If someone were to tell policymaker X about your research in a one-minute elevator conversation, what would you want them to say?

Thoughts on Clear Language

- “Old words are best and short old words are best of all.” – Winston Churchill.

- Be ruthless about taking out jargon in policy-related communications. And yes, “externality” is jargon.
- Look for long sentences, >25 words, and eliminate extraneous words or break into two.
- Rule of thumb: Tell me what your research says in under 20 understandable words.

Quotes on Data Visualization

"Let the dataset change your mindset."

"Most of us need to listen to the music to understand how beautiful it is. But often that's how we present statistics: we just show the notes, we don't play the music."

- H. Rosling

"There is no such thing as information overload. There is only bad design."

- E. Tufte

"Visualization gives you answers to questions you didn't know you had."

- B. Schneidermann

"Data is not the new oil; it the new soil"

- D. McCandless

The digital revolution is generating more environmental data than ever before, more ways to engage people, and more ways to use this data for spatial planning and decision-making.

Big Data / Earth Observation

Cloud computing

Artificial intelligence

5 billion unique mobile phones
2.5 billion smart phones

Internet of
Things (IoT)

Open source data and
software widely available

We are at a pivotal moment in environmental history where the way in which we deploy these technologies offers the possibility to measure and protect our planet.

Why Giving Thought to Visualisation is Important

Help users to overcome “information overload” or “data glut”.

Present-day demand / expectation for visual aspect to information.

Achieve two primary purposes: convey story and establish credibility.

Design information so that it tells a story, and allows us to focus on the information that is truly important to users.

Present meaningful patterns and connections.

Principles of visualisations

Saliency

- Relevance
- Ease of application

Robustness

- Scientific confidence
- Uncertainties

Richness

- From highlights to detail
- Caveats and contextual information

Simplifying
information
to tell big
stories

WEIGHT OF VERTEBRATE LAND ANIMALS

Companies Expect Climate Change to Cost Them \$1 Trillion in 5 Years

The Financial Crisis Cost the U.S Economy \$22 Trillion

UN says solving food crisis could cost \$30 billion

Land degradation costs the world up to \$10.6tn a year, report says

Cost of Conserving Global Biodiversity Set at \$76 Billion

The infographic features the Roll Back Malaria Partnership logo at the top left. The main headline reads "Let's #endmalaria FOR GOOD" with a checkmark. Below this, a hand is shown putting money into a white sack labeled "Since 2000, the investment in malaria has proven to be a smart one...". To the right, a heart icon contains the number "7m" with the text "It is saving lives... More than 7 million people so far". Below the heart, it says "leading to US\$2 trillion in benefits to malaria affected countries". At the bottom, there is a hashtag "#EndMalaria #WHA70" and a small Roll Back Malaria logo.

ROLL BACK MALARIA PARTNERSHIP

Let's #endmalaria FOR GOOD

*Harnessing the power of
spatial data and frontier
technologies
to solve environmental
challenges*

A statement like “*South Sudan will likely experience an average of 1 degree increase in temperature from climate change*” is **not actionable** for planning and risk reduction. Spatial data paints a different picture and offers layers of context.

The local impacts of environmental degradation and climate change are also place-specific.

Time series statistics on deforestation levels are a good start. But the location of deforestation is critical to understand. Is it occurring within protected areas ?

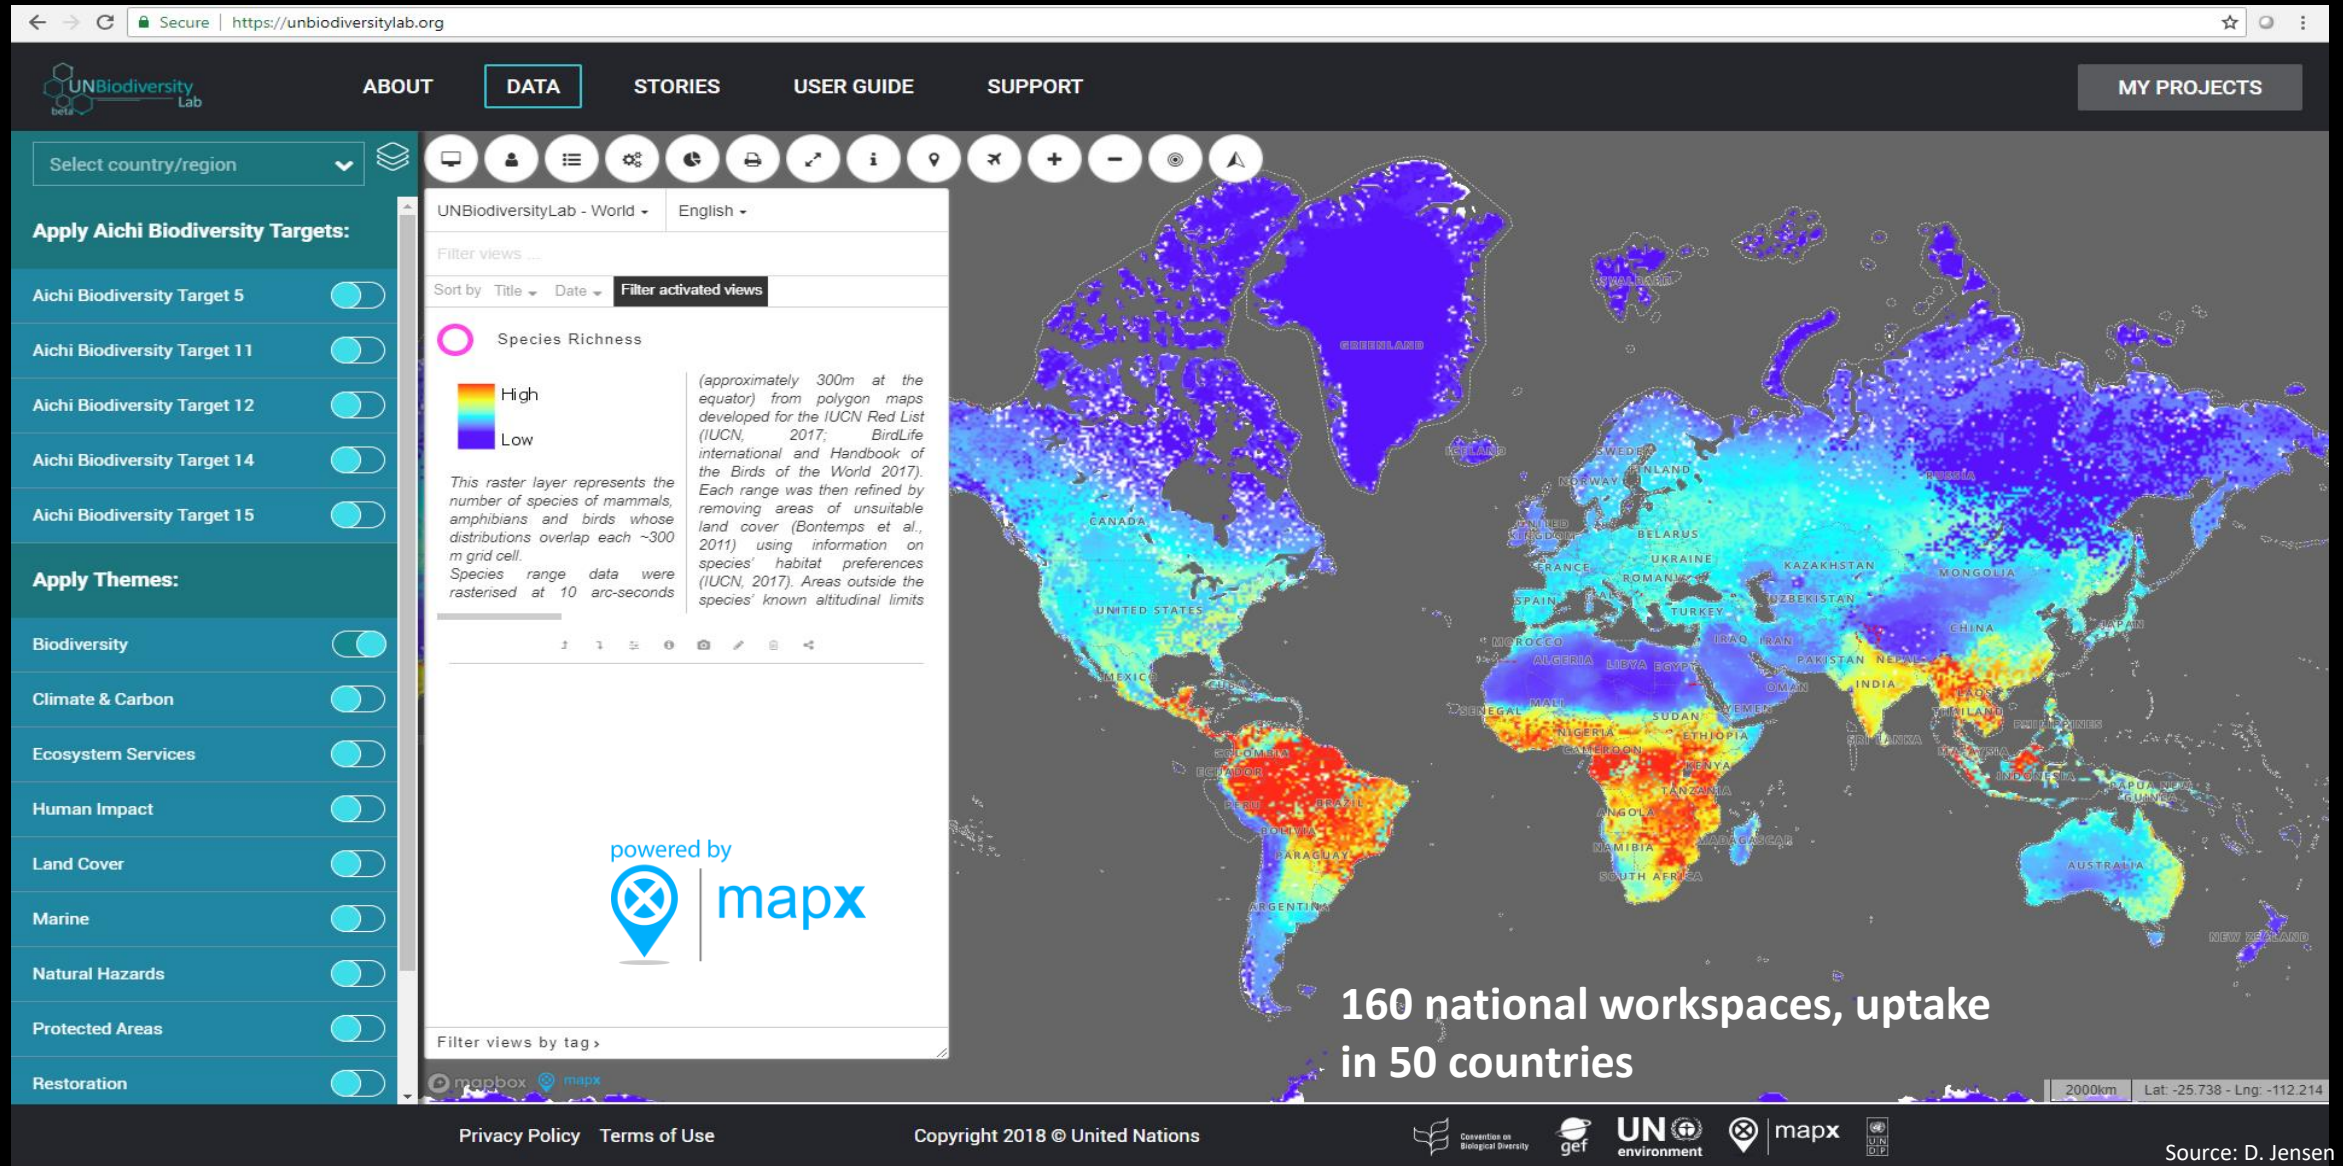

The local impacts of environmental degradation and climate change are also place-specific.

Africa Regional Data Cube - ARDC

A data cube provides analytically ready data across decades allowing for easily accessible geospatial analysis on key issues. The initial focus for the data cube was on algorithms to address priorities identified by GPSDD partners across **5 countries**:

Welcome to the Africa Regional Data Cube

CEOS is using the power of the Open Data Cube to help address the needs of satellite data users, giving them a better picture of their land resources and land change.

- Ease of use and access to satellite-based data
- Multiple dataset interoperability and spatial consistency
- Use of "Analysis Ready" Data Products
- A Shift in Paradigm from Scenes to Pixels

SDG 6.6.1 - Water extent

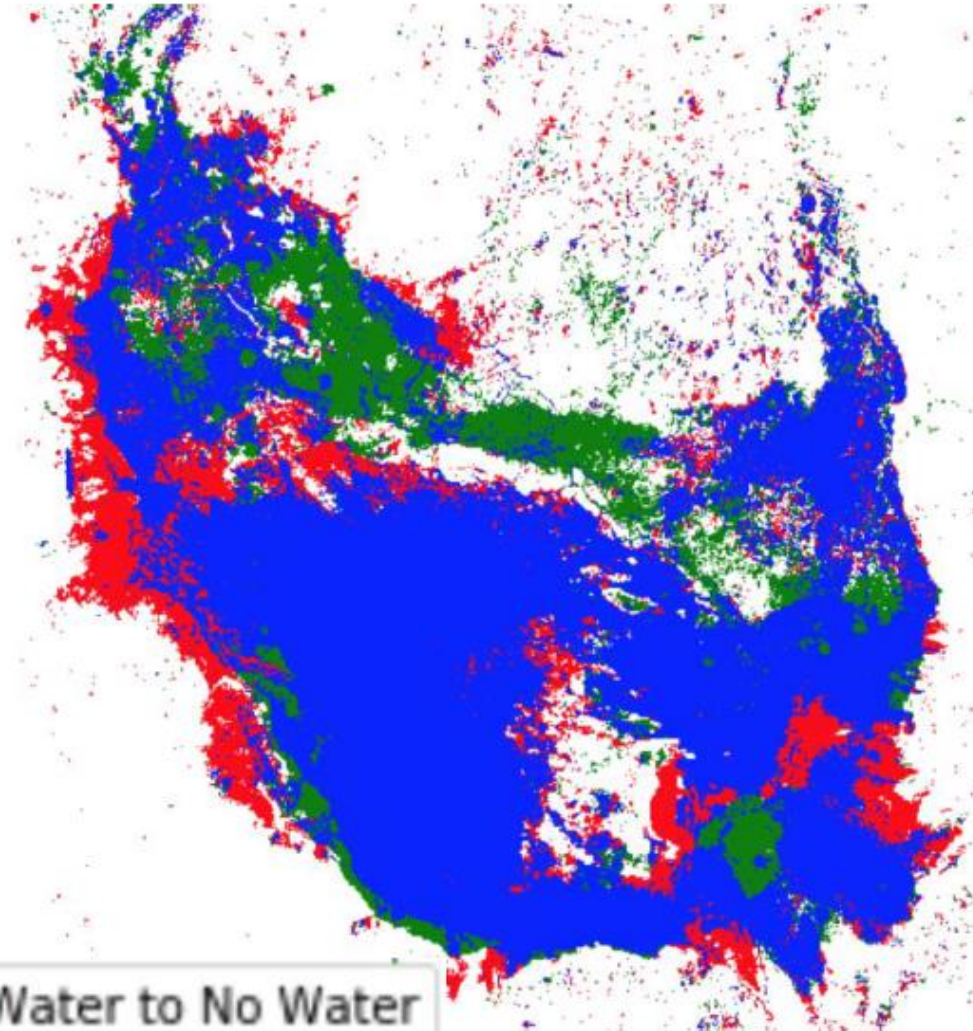

Lake Sulunga in Tanzania

From 2014 to 2018, there is a net loss of 3.8% of water pixels. This is considered an “Unmodified Natural” change or “Class-A”.

Analysis followed the UN-SDG 6.6.1a indicator methodology (20 Jan 2017) and used the Landsat WOFS water detection algorithm.

Apr 2013

Urbanisation – SDG 11.3.1 – Nairobi, Kenya

[ESA Urban Tep, WSF - 2015](#)

Urbanization in Nairobi, Kenya – 2002 to 2017 (15 years)

Urban Area Growth = 6.7% per year (Landsat-7 Fractional Cover, 0.6 threshold)

Population Growth = ~ 4 % per year (according to several web sources)

SDG 11.3.1 - Ratio of land consumption rate to population growth rate
