

Ecosystem Extent and Condition accounts in Spain

Fernando Santos Martín and Adrián García Bruzón

Virtual Expert Forum on SEEA-EEA, 23 June 2020

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 817527

I. Spatial units and extent accounts

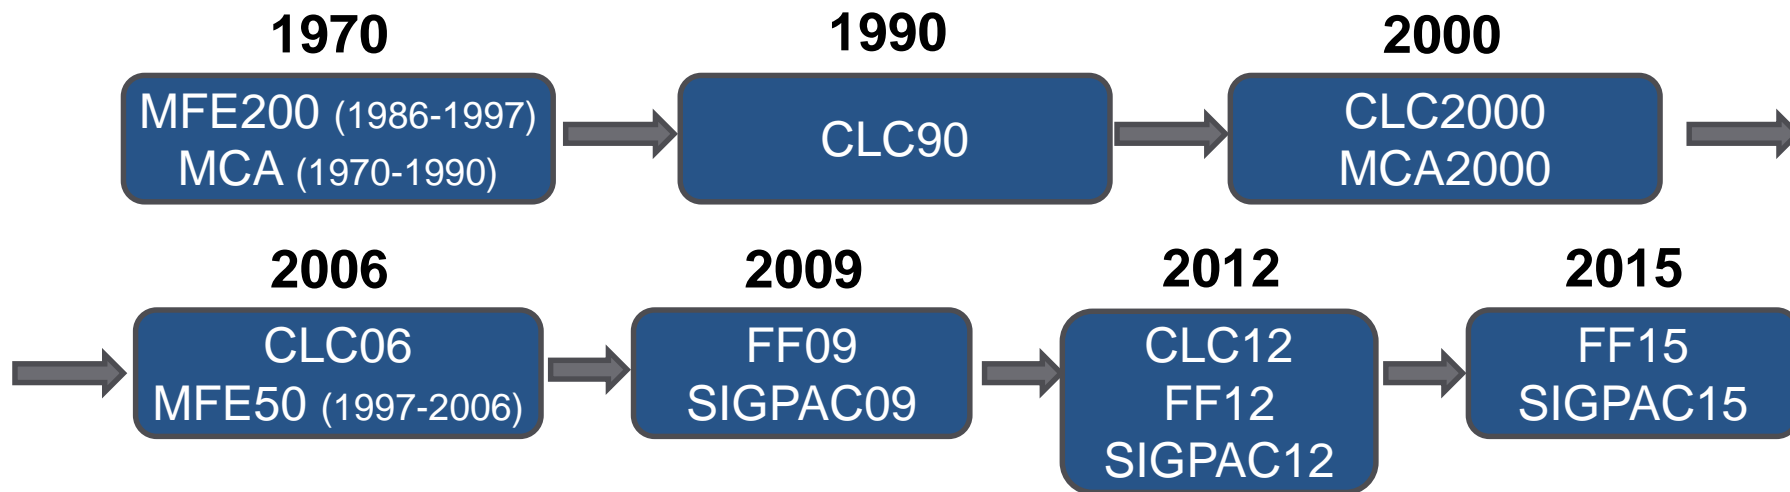

- a. Spanish national Ecosystem Types classification used for ecosystem extent accounts
- b. Main testing results for cross walking with IUCN and/or VES
- c. Identify and discuss the main bottlenecks.

II. Condition accounts

- a. Methodology based on the 3 stages: (1) reporting variables, (2) reference levels, (3) aggregation
- b. Example on Forest condition accounts in Spain
- c. Main gaps and needs to improve ecosystem condition

Spanish ecosystem types classification

In Spain we are using LULUCF (Land Use, Land Use Change and Forestry) a multisource dataset for ecosystem accounting. LULUCF provide a high spatial resolution (25 meters per pixel) information for a significant time period (1970-2015).

MFE200: Spanish Forest Map. 1:200.000

MCA: Crop and Harvest Map

CLC: Corine Land Cover

MFE50. Spanish Forest Map. 1:50.000

FF: Update of changes in MFE50

SIGPAC: Geographic Information System
of Agricultural Plots

Fig. I. Spanish LULUCF including the principal data source for each time period. **Source:** Spanish Ministry for the Ecological Transition and the Demographic challenge

Spanish ecosystem types classification

LULUCF (level 2) divided the territory in 16 categories as ecosystem types. MAES (level 1) typology distinguishes 12 main ecosystem types, which is a European reference classification with cross linkages to the habitat types listed in Annex I of the Habitats Directive.

LULUCF_level_1	id_1	MAES_level_1	LULUCF_level_2	id_2
Forest land	100	Forest and woodland	Broadleaved	110
			Coniferous	120
			Mixed	130
			Other Forests	100
Grassland	200	Grassland	Woodland	210
		Heathland and shrub	Shrubland	220
		Grassland	Perennial	230
			Other Grassland	200
Other Land	400	Sparsely vegetated land	Other Land	400
Wetlands	500	Inlands wetlands	Wetlands and Peatlands	500
		Rivers and lakes	Inland	510
		Marine inlets	Seaside	520
Cropland	700	Cropland	Perennial woody crops	710
			Annual crops	720
			Other Crops	700
Settlements	800	Urban	Settlements	800

Table I. Crosswalks between LULUCF and MAES ecosystem classification

Settlements	800	Settlements									1	1	1	1

Table 2. Results of the cross walking between LULUCF and IUCN ecosystem types classification

Testing results for cross walking LULUCF with IUCN

MAIA
Mapping and Assessment for
Integrated ecosystem Accounting

Some bottlenecks

1. LULUCF classification do not include all temperature regimen (e.g. tropical, subtropical...) that in IUCN its crucial for natural and seminatural forest / shrublands ecosystems.
2. The classification in Agroecosystems is more detailed in LULUCF than in IUCN. These classifications are very important divisions in the context of Spain (Mediterranean).

Integrated ecosystem Accounting

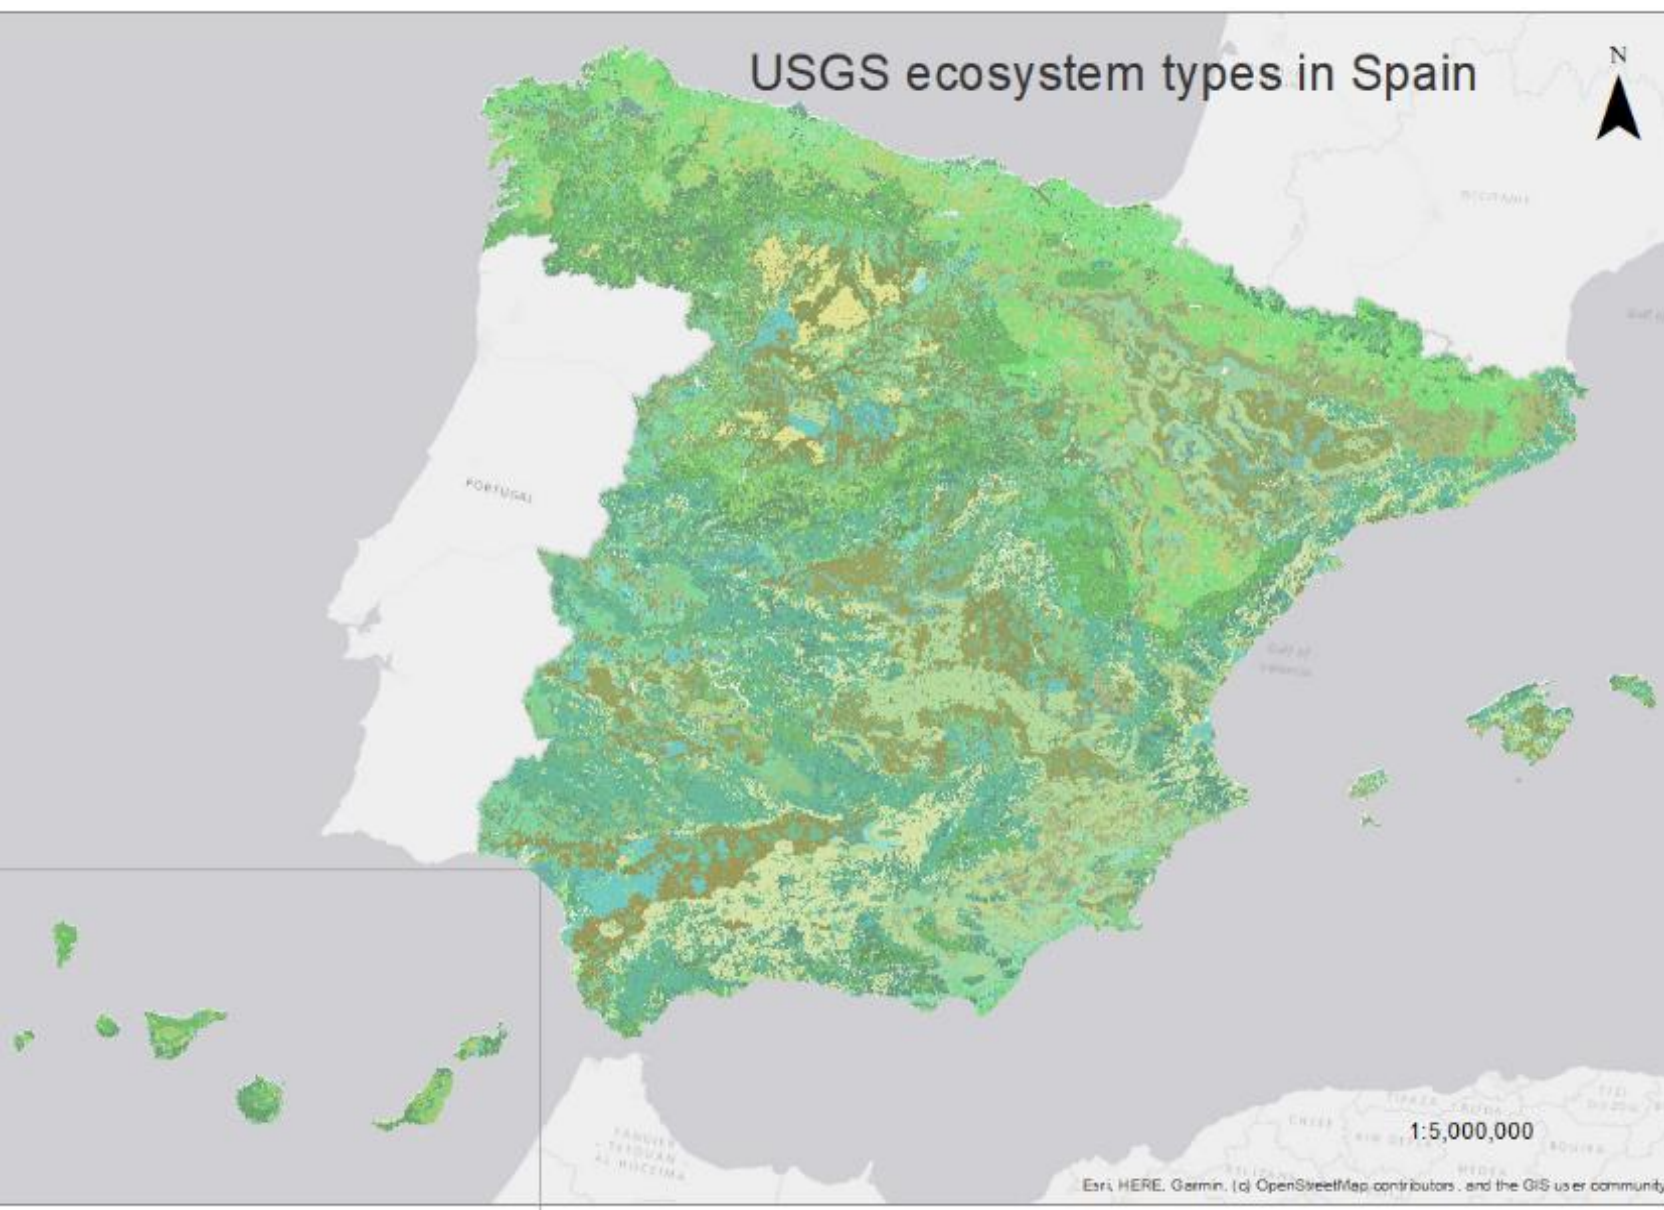

Fig. 3. Spanish map with the 190 ecosystems types identified using the USGS-ESRI word ecosystem

Testing results for cross walking with USGS-ESRI work ecosystem

MAIA
Mapping and Assessment for
Integrated ecosystem Accounting

Some bottlenecks

1. We can improve the suitability of this classification by including more local information as local landform classification based on a digital terrain model developed for Spanish Geographic Institute.
2. We identify an important gap in water ecosystem as wetlands.

Forest Condition Accounts

Stage 0. Ecosystem typology

MAIA
Mapping and Assessment for
Integrated ecosystem Accounting

Based on LULUCF forests categories (**3 types: broadleaved, coniferous, mixed**) we use a national classification of forests to create a more detailed forest categories (**48 forest types**) to assess condition. We use the next categories:

Table 3. Main categories to define forest ecosystem types to assess condition accounts in Spain

LULUCF	NATIONAL INVENTORY	BIOGEOGRAFICAL REGIONS
Broadleaved	Evergreen	Alpine
Coniferous	Deciduous	Atlantic
Mixed	Natural	Mediterranean
	No natural	Macaronesia

Fig. 3. Map of biogeographical regions in Spain. Source Ministry of Ecological Transition and Demographic Challenge

		0.5	Forest Area Density	LULUCF	50

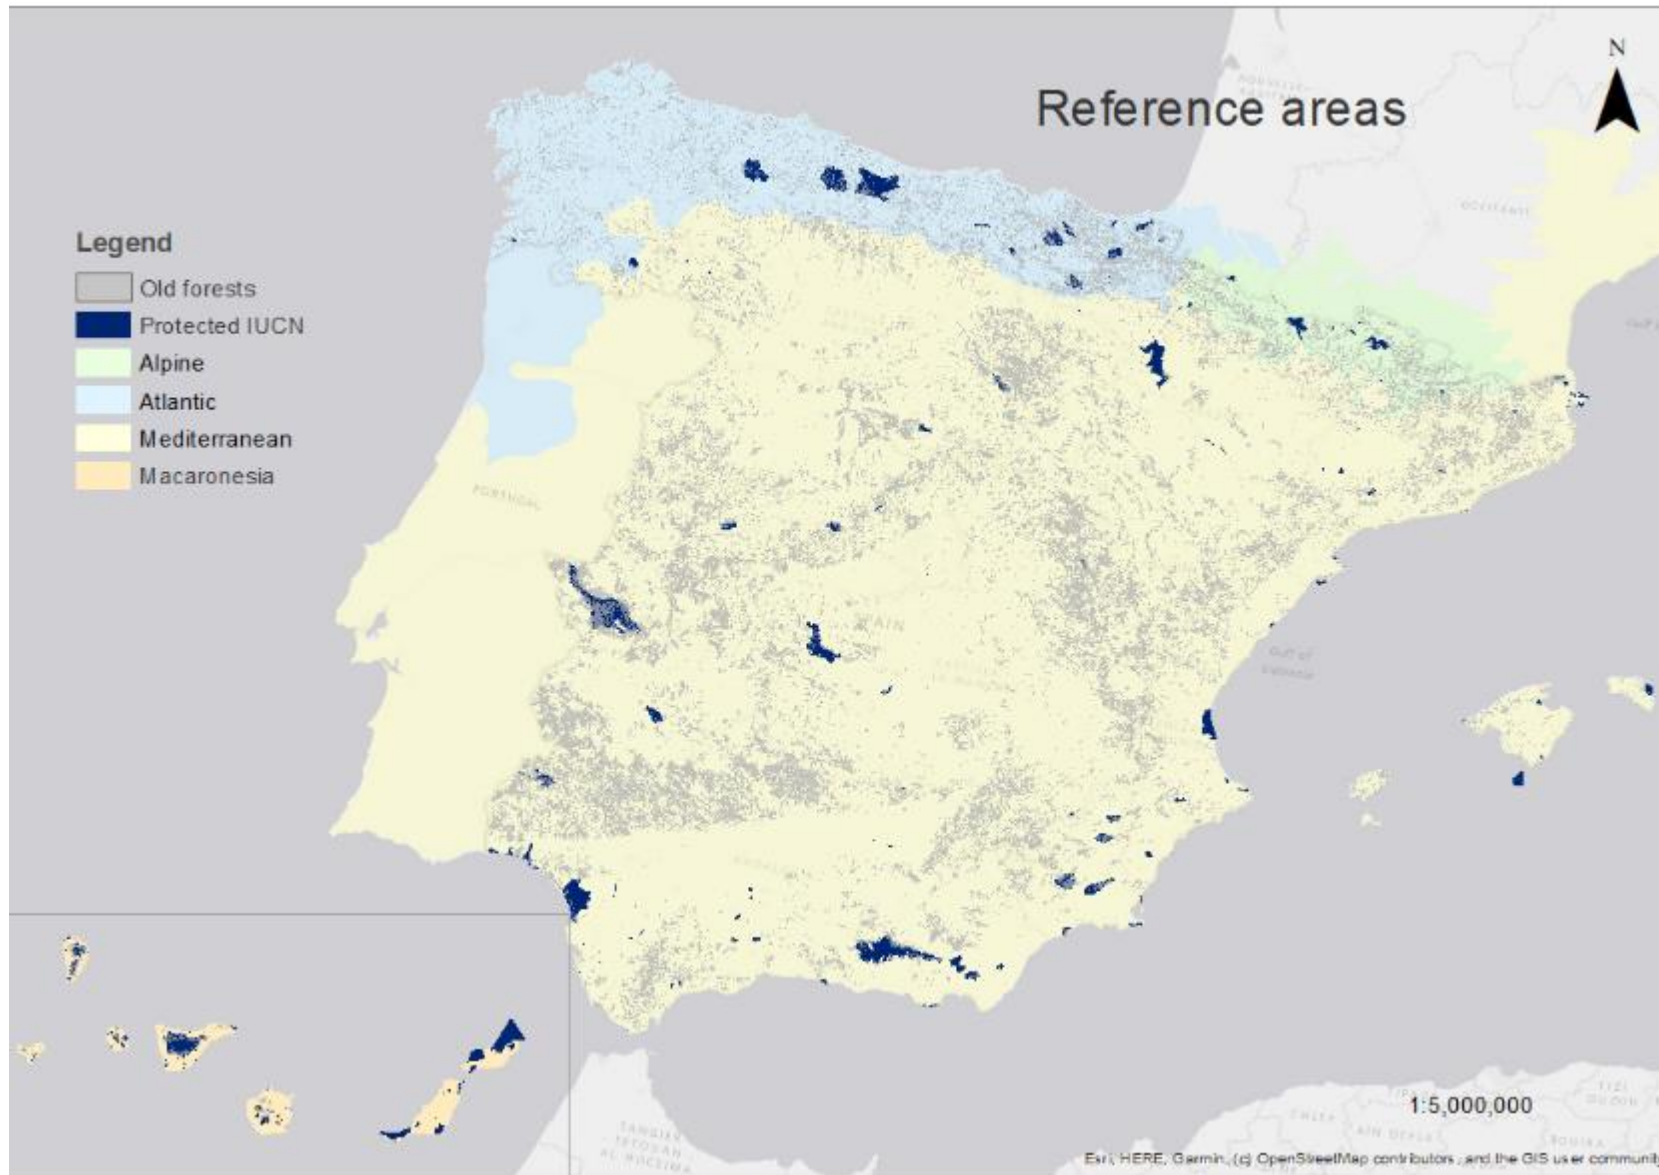

Table 4. 14 national variables selected to assess forest condition and their characteristics following the hierarchical classification SEEA EEA ecosystem condition typology (SECT).

Forest Condition Accounts

Stage II Reference level

MAIA
Mapping and Assessment for
Integrated ecosystem Accounting

We used the reference based on the criteria of minimum disturbance:

- Protected areas classify by IUCN as level I, II, III or IV.
- Forests with not net change since 1970.

Fig. 5. Reference condition areas to assess forest condition accounts in Spain

Forest Condition Accounts

Stage 3 Aggregation

MAIA
Mapping and Assessment for
Integrated ecosystem Accounting

General idea: Evaluate the distance between the normalized variables in the reference areas with the all of the forest by class and region.

Calculation: Euclidean distance weighted (Equation 1). To aggregation proposes we used the average reference values of the reference areas by group and region.

$$Edw = \sqrt{\sum_i^j w_i (x_i - y_i)^2} \quad \text{Equation 1}$$

Creation of and ecosystem condition index. Results of the calculation were divided in four categorical quartiles (a. Unfavorable: less to 25%, b. Regular: 25-50%, c. Average: 50-75%; and d. Favorable: higher than 75%).

Forest Condition Accounts

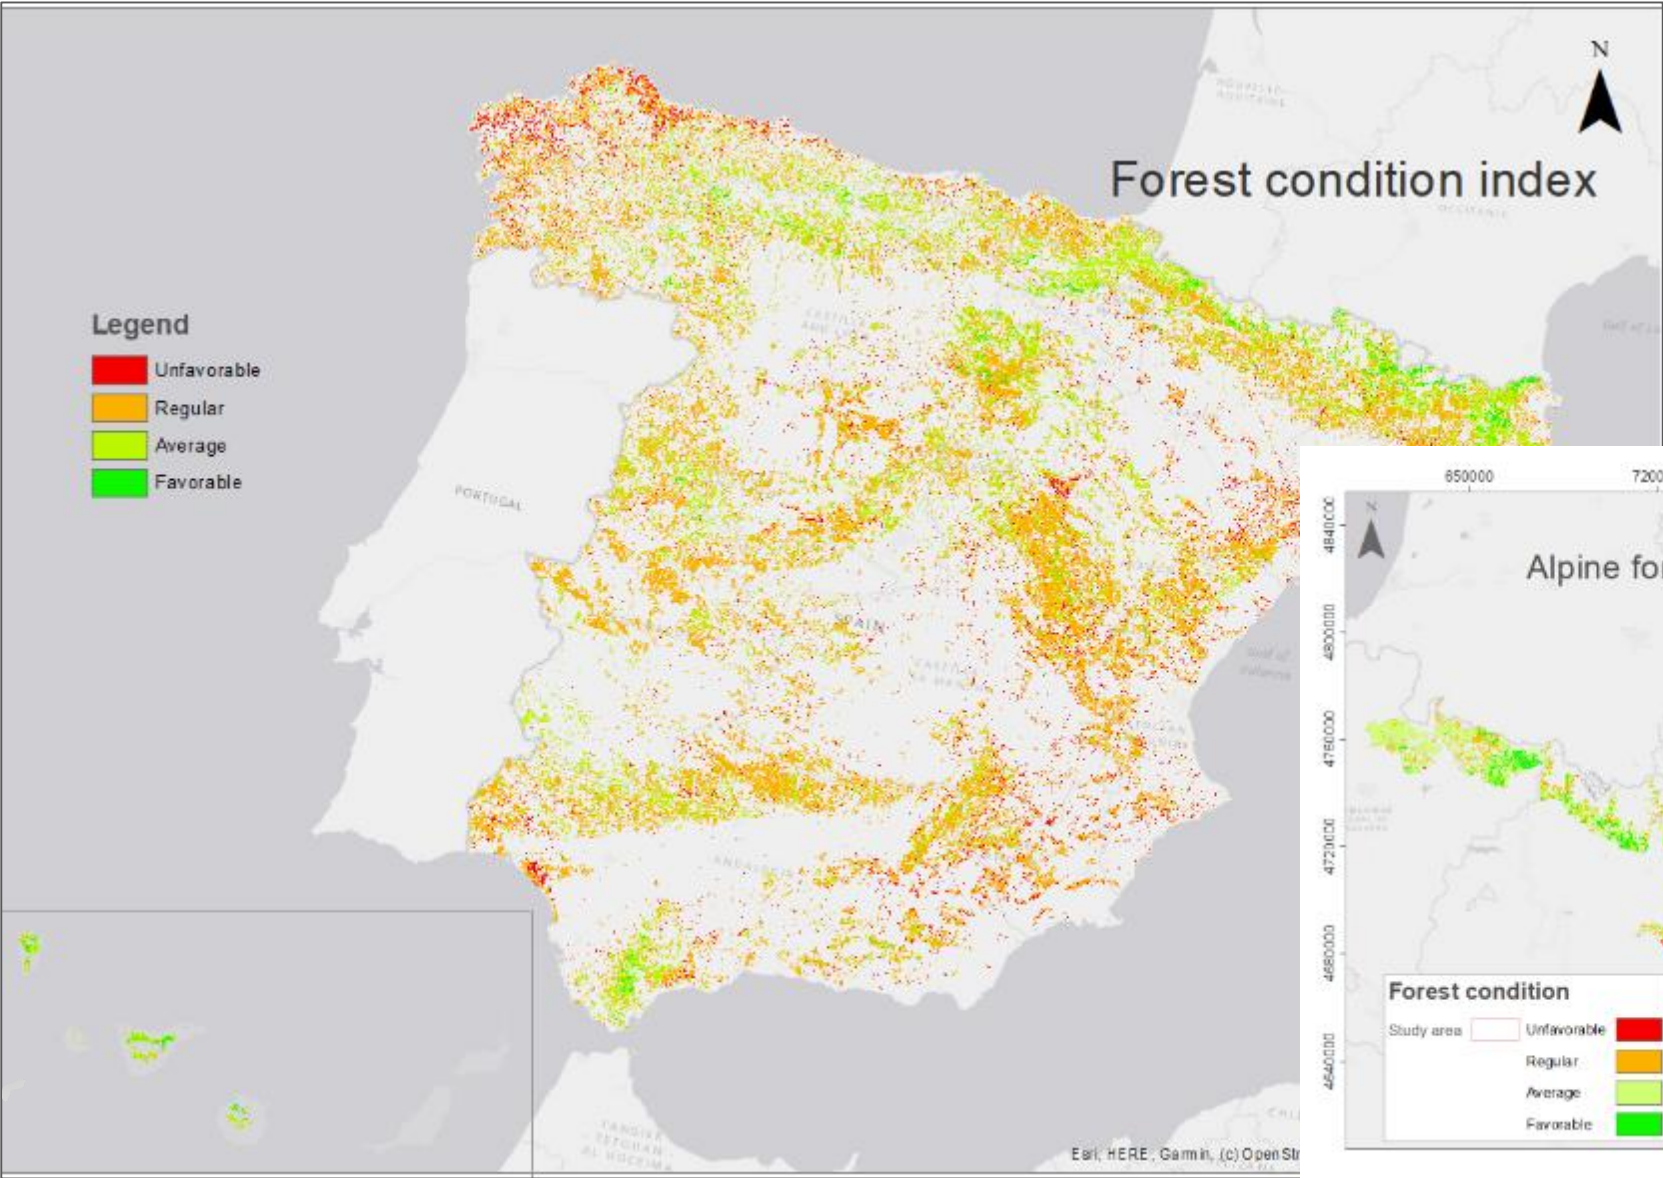

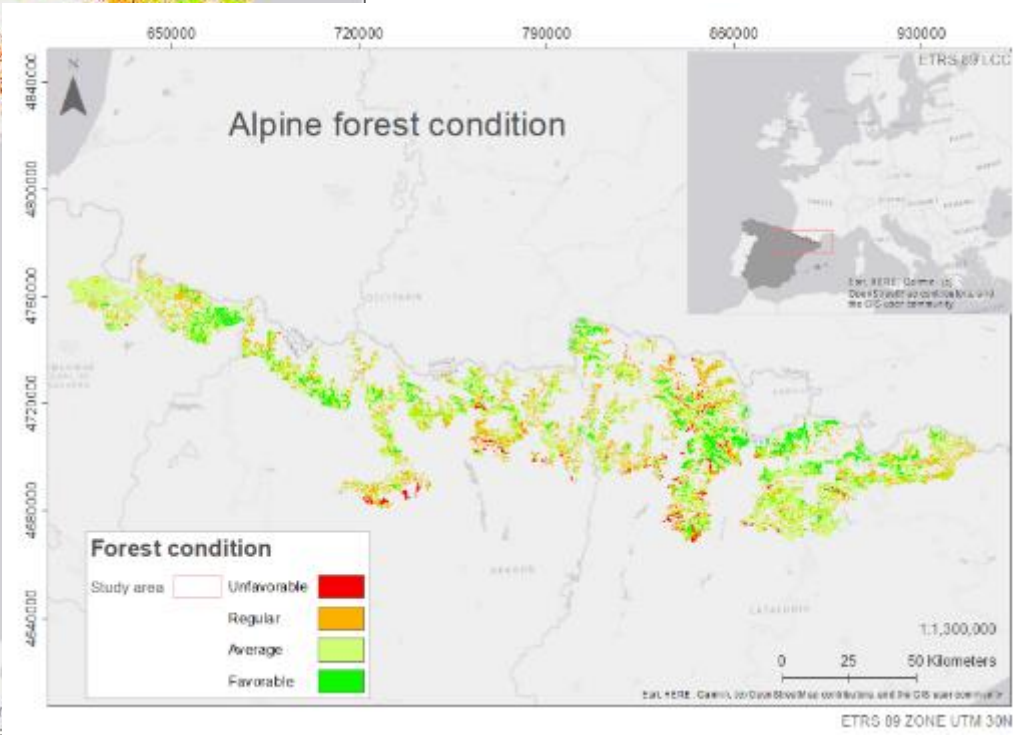

Fig. 6. Map of Spanish forest condition index

- Exits enough sources of data available to develop extent and condition accounts at national level.
- The appropriateness to link existing land use data and ecosystem classifications need further analysis.
- The proposed international ecosystem classification (IUCN) need further development to be applicable at different levels (national, regional, local).
- The proposed methodologies to assess condition accounts are still under development and need to be validated. For example, a standard list of indicators and reference levels
- Aggregation methods are need it, but we still need more research to scientifically relates condition accounts index with ecosystem state and trend.
