Australian  
National  
University

# Outline of presentation

- Accounting, assets, flows
- Production boundary and own-account production
- Flows with example
- Recording of agricultural use of ecosystem services
- Water valuation
- Conclusion

# INTRODUCTION

# Water and accounting

System of National Accounts

SEEA Water (original and best?)

Central Framework

Ecosystem accounting

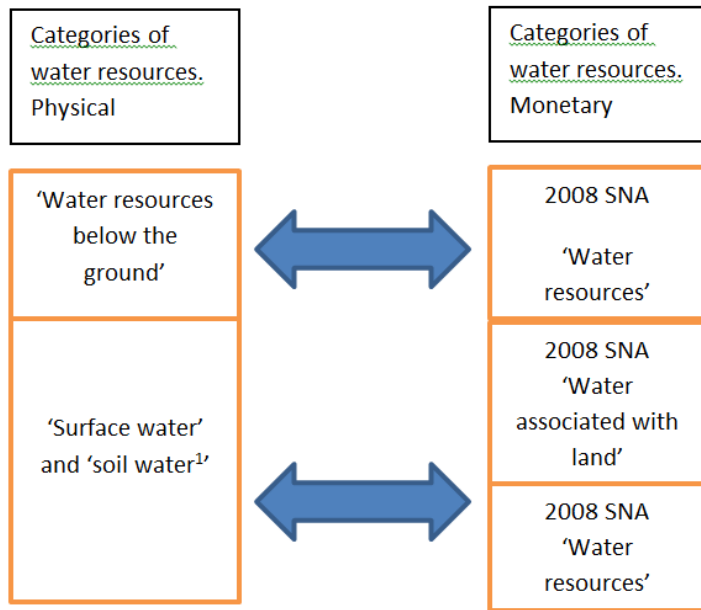

Different scope, coverage and classifications

- Assets
- Flows (SEEA Central Framework and SEEA Water explicitly included return flows, SEEA Water a more complete representation of hydrological system)
- When are they the same and when are they different?

# Water assets in the SNA and SEEA Central Framework

## SEEA Central Framework to SNA asset items

<sup>1</sup>Soil water is assigned to the SNA category 'water associated with land'

### The 2008 SNA assigns

- All groundwater to 'water resources'
- Water integrated with land ownership to 'water associated with land', which includes soil water
- Surface water subject to purchase, extraction and use in production as part of 'water resources' (along with groundwater).

### SNA 'Water associated with land':

- "any inland waters (reservoirs, lakes, rivers, etc.) over which ownership rights can be exercised and that can, therefore, be the subject of transactions between institutional units". (2008 SNA, paragraph 10.175.)

SNA also has a 'permit to use a natural resource' which includes such things as tradable water rights. This is not the water, but may be used to value water

### SEEA Central Framework

- Surface water, groundwater, soil water, seas and oceans (corresponds with GET classes)

# Ecosystem assets related to water

## SEEA Ecosystem Accounting Asset types (pp. 57)

- Freshwater
    - F1 Rivers and streams
    - F2 Lakes
    - F3 Artificial reservoirs
  - Transitional
    - TF1 Palustrine wetlands
    - FM1 Semi-confined transitional waters
    - MFT1 Brackish tidal systems
    - SF1 Subterranean freshwater
    - SF1 Anthropocentric subterranean freshwater
- The classes aligns with the SEEA Central Framework

# Ecosystem services related to water

SEEA Ecosystem Accounting services(pp. 131 to 133)

Provisioning services

- Water supply

Regulating and maintenance services

- Soil and sediment retention
- Water purification
- Water flow regulation
- Flood control
- Nursery and population habitat services

Cultural services

- Recreation
- Visual amenity
- Spiritual, artistic and symbolic services

# PRODUCTION AND OWN-ACCOUNT PRODUCTION

# Production boundary

The production boundary of the SNA includes the following activities:

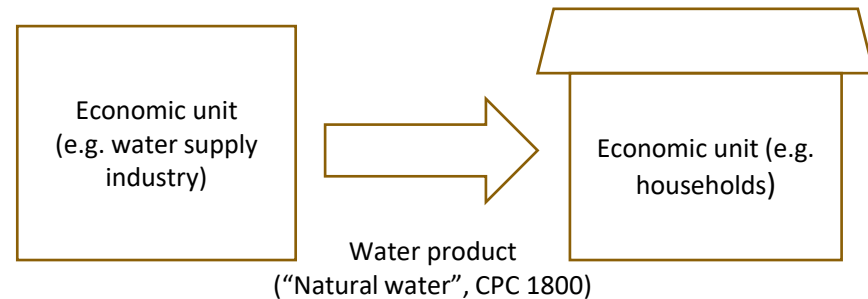

- a. The production of all goods or services that are supplied to units other than their producers, or intended to be so supplied, including the production of goods or services used up in the process of producing such goods or services;
- b. b. The own-account production of all goods that are retained by their producers for their own final consumption or gross capital formation;
- c. ... (SNA para. 6.27)

Issue 16 Outcome Paper for Central Framework Development Recommendation 16.1:

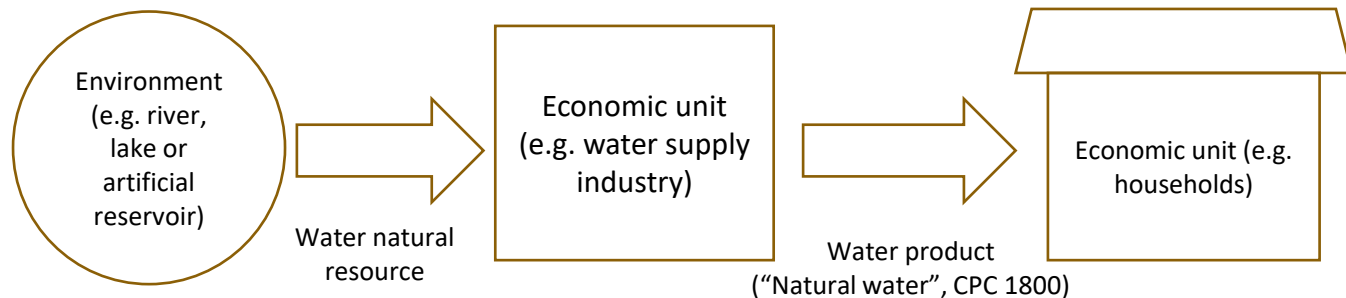

- “That in the revised SEEA, the production boundary of the SNA should be extended such that water in artificial reservoirs should be treated as entering the supply of the economy at the time it enters the artificial reservoir and the net recharge of water to artificial reservoirs should be recorded as a change in inventories.”
- Degrees of management (regulation)

# FLOWS WITH EXAMPLE

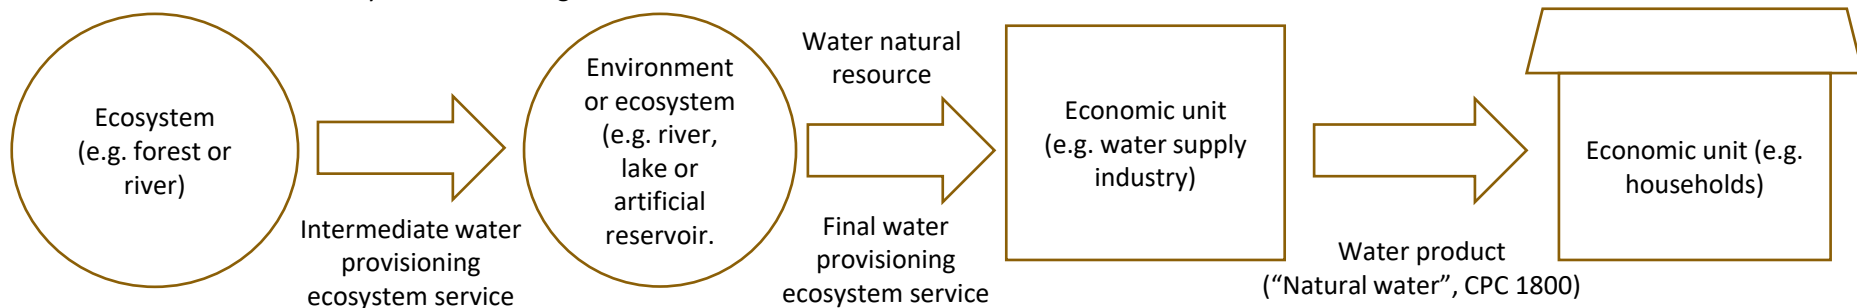

### 1 a. Water flows in SNA

### 1 b. Water flows in the SEEA Central Framework

### 1 c. Water flows in SEEA Ecosystem Accounting

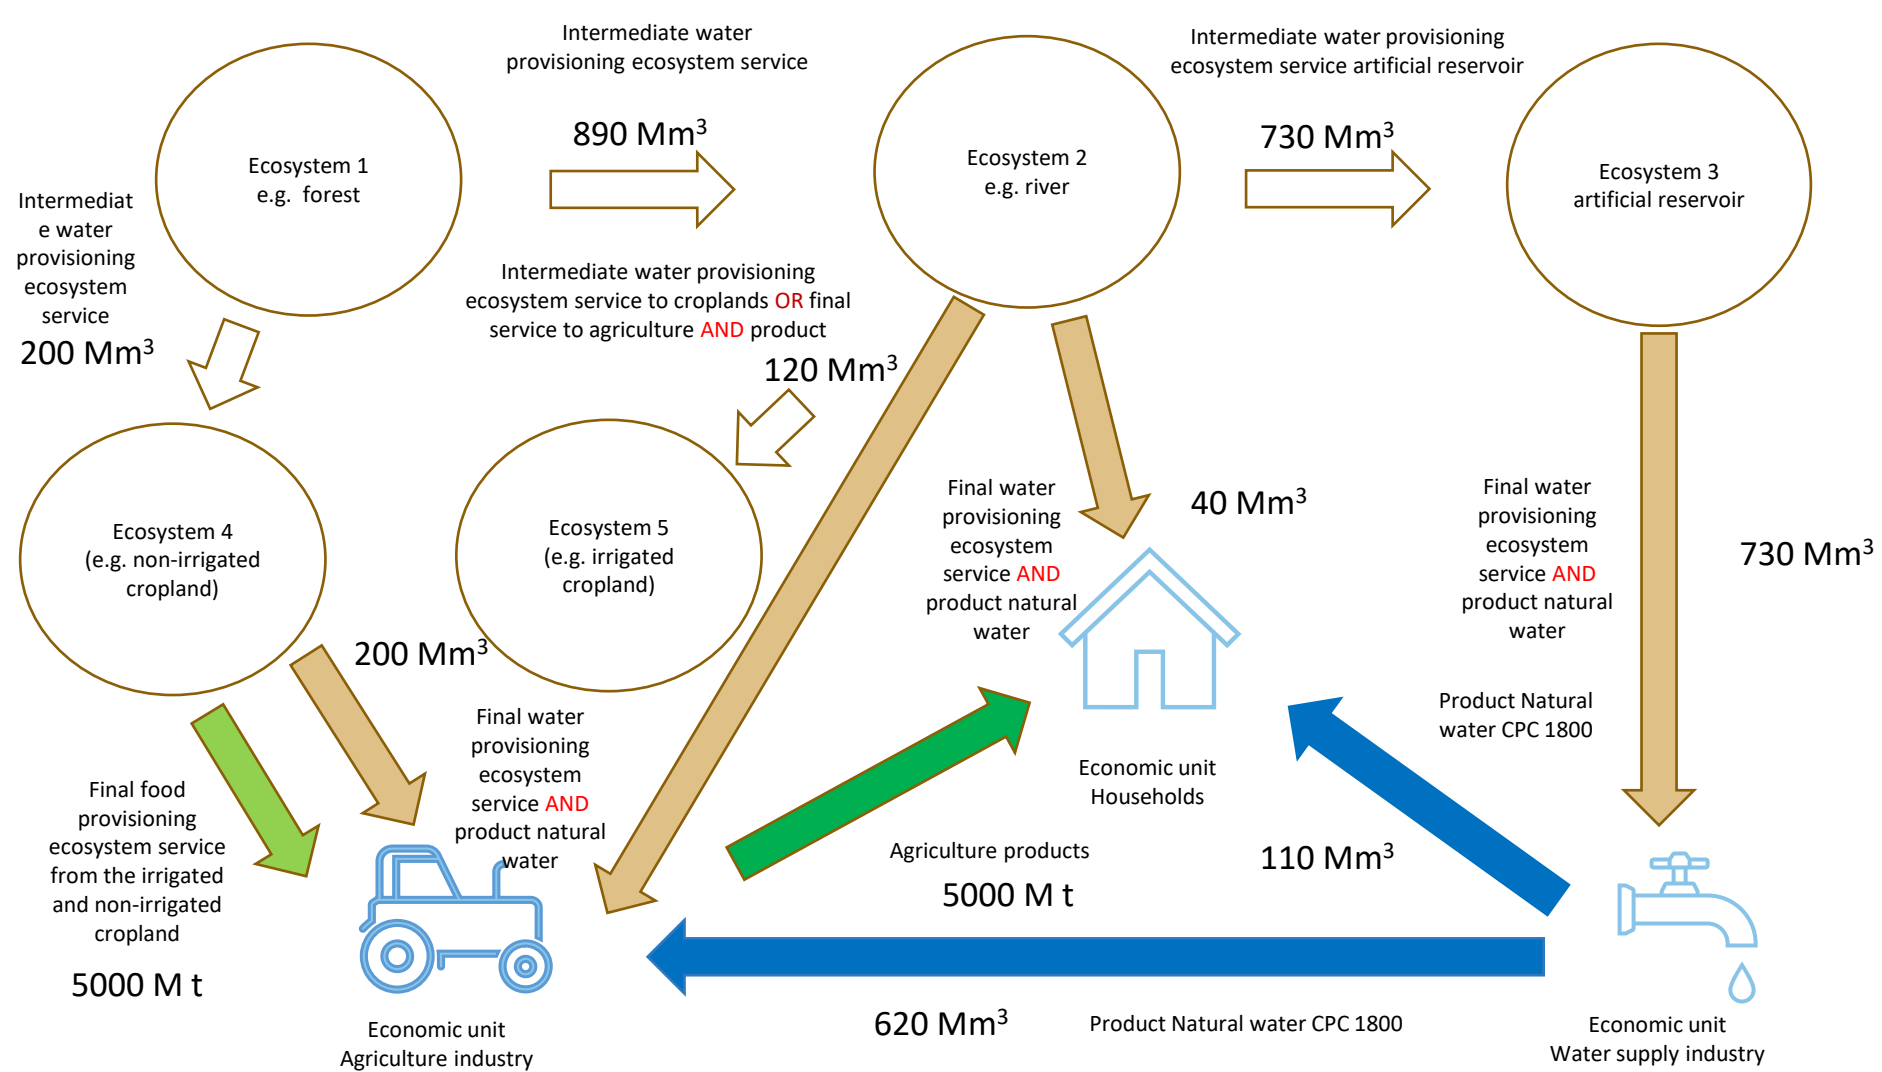

Table 1a. River supplies agriculture and existing production boundary

# Treatment of water use by agricultural land

SEEA Central Framework	SEEA Ecosystem Accounting
<b>Non-irrigated cropland</b> <ul style="list-style-type: none"><li>• Uses soil moisture<ul style="list-style-type: none"><li>- Source of source moisture is direct precipitation plus run-off</li></ul></li><li>• Use of soil moisture by agriculture</li></ul>	<b>Non-irrigated cropland</b> <ul style="list-style-type: none"><li>• Uses intermediate water provisioning service from other ecosystems<ul style="list-style-type: none"><li>- Runoff from other ecosystems transpired by crops</li><li>- Precipitation onto the non-irrigated cropland (atmosphere as an ecosystem) transpired by crops</li></ul></li><li>• Use of all water by agriculture</li></ul>
<b>Irrigated cropland</b> <ul style="list-style-type: none"><li>• Use surface and groundwater from water suppliers (including own-account production), and soil moisture<ul style="list-style-type: none"><li>- Source of source moisture is direct precipitation plus run-off</li></ul></li><li>• Use of all water by agriculture</li></ul>	<b>Irrigated cropland – options 1</b> <ul style="list-style-type: none"><li>• Water ecosystems (e.g. rivers, artificial reservoirs) <u>supply</u> the final water provisioning ecosystem services to agriculture</li></ul> <b>Irrigated cropland – options 2</b> <ul style="list-style-type: none"><li>• Irrigated croplands <u>use</u> of intermediate water provisioning ecosystem services from water ecosystems (e.g. rivers, artificial reservoirs) by irrigated cropland</li><li>• Irrigated croplands <u>supply</u> the final water provisioning ecosystem service to agriculture</li></ul>

# Implications of treatment of water flows and agriculture for valuation

To what ecosystem asset is the value of water being attributed?

- **Croplands**
  - The value of water provisioning service embedded in the food provisioning service
- **Water ecosystems**
  - Direct attribution of water provisioning service

**Need to identify possible double counting**

- Possible to alternative, non-additive presentations (like industry and sector in SNA)

# Water and renewable energy

Is this a use of an ecosystem service of water provisioning?

- Certainly, a use of water in the SEEA Central Framework (both natural resource and product and return flows)
- Could be the use of the ecosystem service of gravity!

For the value of hydroelectricity simplest to record the value under renewable energy

# VALUATION

# Academic studies of water valuation

## Massive literature

- 2657 articles identified via Scopus search

Several reviews of water valuation (Kind et al 2020, Siikamaki et al. 2021)

Need to identify approaches consistent with exchange values

Determine the data available to support valuation

- Price x quantity = value
- Quality of water
- Price a function of many things (e.g. relative scarcity and demand)

[https://www.epa.gov/sites/default/files/2018-10/documents/estimating\\_value\\_of\\_water\\_lit\\_review.pdf](https://www.epa.gov/sites/default/files/2018-10/documents/estimating_value_of_water_lit_review.pdf)

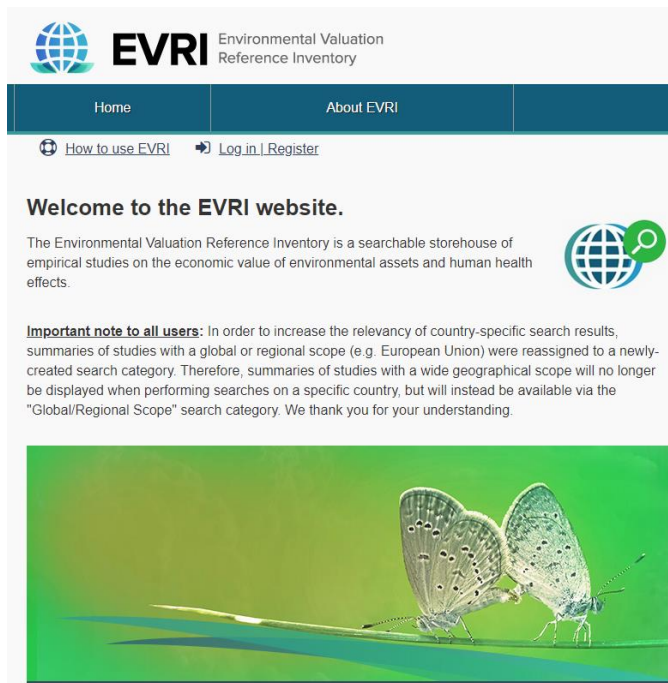

# SEEA – valuation concepts and methods

Methods suitable for estimating exchange values as listed in the SEEA Ecosystem Accounting in order of preference (p. 193):

- i. Methods where the price for the ecosystem service is directly observable;
- ii. Methods where the price for the ecosystem service is obtained from markets for similar goods and services;
- iii. Methods where the price for the ecosystem service is embodied in a market transaction;
- iv. Methods where the price for the ecosystem services is based on revealed expenditures (costs) for related goods and services;
- v. Methods where the price for the ecosystem service is based on expected expenditures or markets.

# Data bases for environmental valuation

The screenshot shows the homepage of the Environmental Valuation Reference Inventory (EVRI). At the top, there is a navigation bar with 'Home' and 'About EVRI'. Below this, there are links for 'How to use EVRI' and 'Log in / Register'. The main heading is 'Welcome to the EVRI website.' followed by a paragraph describing the database as a searchable storehouse of empirical studies. To the right of the text is a small globe icon with a magnifying glass. Below the text is an 'Important note to all users' section, followed by a large image of two butterflies on a green background.

**EVRI** Environmental Valuation Reference Inventory

Home About EVRI

[How to use EVRI](#) [Log in / Register](#)

## Welcome to the EVRI website.

The Environmental Valuation Reference Inventory is a searchable storehouse of empirical studies on the economic value of environmental assets and human health effects.

**Important note to all users:** In order to increase the relevancy of country-specific search results, summaries of studies with a global or regional scope (e.g. European Union) were reassigned to a newly-created search category. Therefore, summaries of studies with a wide geographical scope will no longer be displayed when performing searches on a specific country, but will instead be available via the "Global/Regional Scope" search category. We thank you for your understanding.

<https://www.evri.ca/>

The cover of the 'Ecosystem Services Valuation Database (ESVD)' report features a world map with regions color-coded: North America (blue), South America (dark blue), Europe (red), Africa (orange), Asia (yellow), and Australia (brown). The text on the cover includes the title, subtitle, final report date, preparer (Defra, UK), contract reference, lead authors, contributing authors, and a citation suggestion. Logos for the Foundation for Sustainable Development and Brander Environmental Economics are at the bottom.

## Ecosystem Services Valuation Database (ESVD)

Update of global ecosystem service valuation data

**Final report (June 2020)**

Prepared on behalf of the Department for Environment, Food and Rural Affairs (Defra, UK)  
Contract Reference: ecm\_55549

# CONCLUSION

# Conclusions

- The supply of the natural resource water from natural resource water (non-produced) assets to the supply of water provisioning ecosystem service from water ecosystems assets (rivers, lakes, artificial reservoirs, subterranean) **is equivalent**
- In the case of supply of water from water natural resources and water ecosystem assets these flows **are equivalent to the product flow CPC 1800 “Natural Water”** (with the point is becoming a product changing with the production boundary)
- The supply and use of the water provisioning ecosystem services from non-water ecosystem assets to industry is open interpretation and conventions need to be established – at least two options
- Valuation remains an issue
  - Distinguishing the different types of physical water flows and the assets producing and using water provisioning ecosystem services is a useful step. Doing this can help identify actual or potential double counting of ecosystem service flows in asset values
  - Value of some water flows (or assets) will be embedded in assets (e.g. land)
